Jacob's Ladder

(Alternating current.)

Δ time $\longrightarrow$ change in $\Delta V \longrightarrow \Delta I$ && ΔR.

$R(t+2) \approx R(t) \Rightarrow$ 2 second period.

<< from data >>

except for the first

(t: 0.1 sec, 0.2 sec, 0.3 sec)

$\Downarrow$

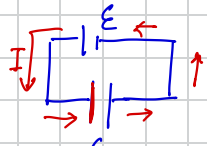

therefore: $R(0.1) \neq R(2.1) \neq R(4.1)$.

0.2

0.3.

However, when $\Delta V = 0 \Rightarrow I \neq 0$.

Why?
- inertia? → ≈ Newton's 1st Law
- capacitance? → ≈

⇓ when ε removed

I moves from (high V to lower V.)

⇒ << but $I \neq 0$ when $\Delta V = 0$??

? ?

↓

it's like an object falling without gravity.
